## CURVE FITTING

## Fitting Equations to Data

This module introduces Curve Fitting ${ }^{1}$ and in particular the Least Squares method. Curve fitting, like Interpolation, is a collection of methods used to represent a set of data by an equation. Unlike Interpolation, curve fitting methods do not require the data points to be taken at equidistant values of the independent variable.

## Learning Objectives

Upon completion of this module the student should :

- Understand the Least Squares Method
- Be able to curve fit data using several types of curves.

## Topics

The following topics will be covered in this module:

- Linear Curve Fitting
- Polynomial Curve Fitting
- Exponential Curve Fitting
- Logarithmic Curve Fitting
- Power Function Curve Fitting
- Examples

[^0]
## CURVE FITTING

## Least-Squares Method:

The method of least-squares is based on the least square criterion that states: The sum of the squares of the differences between the curve-fitted function values and the given tabular values of the function must be minimum.

If we assume that the given tabular data belong to the function $y=f(x)$ and that the curve fitting curve is $\mathrm{Y}=\mathrm{f}(\mathrm{x})$, then the mathematical interpretation of the least squares criterion is:

$$
Q=\sum_{i=1}^{n}\left(Y_{i}-y_{i}\right)^{2} \Rightarrow \text { min imum }
$$

## Linear Curve Fitting:

Linear curve fitting implies that a set of $n$ data points $\left\{\left(x_{0}, y_{0}\right),\left(x_{1}, y_{1}\right), \ldots\left(x_{n}, y_{n}\right)\right\}$, can be represented by a linear equation of the form:

$$
\begin{equation*}
Y_{i}=a_{0}+a_{1} x_{i} \tag{1}
\end{equation*}
$$

provided that Q , the least-squares criterion, conforms to the following requirement:

$$
\begin{equation*}
Q=\sum_{i=1}^{n}\left(Y_{i}-y_{i}\right)^{2}=\min \text { imum } \tag{2}
\end{equation*}
$$

Therefore, in order to curve-fit a set of data with a linear curve we only need to find values for $\mathrm{a}_{0}$ and $\mathrm{a}_{1}$ and substitute them into eq. (1).

To do this we recall from calculus that the maximum or the minimum of a function can be determined by setting the first derivative of the function to zero and solving for the variable(s).

Therefore, values for $a_{0}$, and $a_{1}$ can be found by setting the derivative of eq. (2) equal to zero:

$$
d Q=\sum_{i=1}^{n}\left(Y_{i}-y_{i}\right)^{2}=0
$$

However, $Q$ is a function of two independent variables, $\mathrm{a}_{0}$ and $\mathrm{a}_{1}$. Therefore, we have to use partial differentiation. By substituting equation (1) into (2) equation (2) becomes

## CURVE FITTING

$$
\begin{equation*}
Q=\sum_{i=1}^{n}\left(a_{0}+a_{1} x_{i}-y_{i}\right)^{2}=\min \text { imum } \tag{3}
\end{equation*}
$$

Therefore setting the derivative of (3) equal to zero, we get:

$$
\begin{align*}
& \frac{\partial Q}{\partial a_{0}}=\sum_{i=1}^{n} 2\left(a_{0}+a_{1} x_{i}-y_{i}\right)=0  \tag{4}\\
& \frac{\partial Q}{\partial a_{1}}=\sum_{i=1}^{n} 2\left(a_{0}+a_{1} x_{i}-y_{i}\right) x_{i}=0 \tag{5}
\end{align*}
$$

dividing both sides of (4) and (5) by two, and expanding, we form a system of two equations in two unknowns

$$
\begin{aligned}
n a_{0}+a_{1} \sum_{i=1}^{n} x_{i}-\sum_{i=1}^{n} y_{i} & =0 \\
a_{0} \sum_{i=1}^{n} x_{i}+a_{1} \sum_{i=1}^{n} x_{i}^{2}-\sum_{i=1}^{n} x_{i} y_{i} & =0
\end{aligned}
$$

or

$$
\begin{aligned}
n a_{0}+a_{1} \sum_{i=1}^{n} x_{i} & =\sum_{i=1}^{n} y_{i} \\
a_{0} \sum_{i=1}^{n} x_{i}+a_{1} \sum_{i=1}^{n} x_{i}^{2} & =\sum_{i=1}^{n} x_{i} y_{i}
\end{aligned}
$$

Solve the above system we get values for $a_{0}$ and $a_{1}$. Substituting $a_{0}$ and $a_{1}$ in (1) with the found values for $\mathrm{a}_{0}$ and $\mathrm{a}_{1}$ we obtain the function for fitting the data with a straight line (linear curve fitting).

## CURVE FITTING

## Example:

Curve-fit the data with a straight line: $(0,2),(1,3),(2,5),(3,5),(4,9),(5,8),(6,10)$.

| n | $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{y}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}{ }^{2}$ | $\mathbf{Y}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{l}}-\mathrm{y}_{\mathrm{i}}$ | $\left(\mathbf{Y}_{\mathrm{l}}-\mathrm{y}_{\mathrm{i}}\right)^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 2 | 0 | 0 | $\mathbf{1 . 9 2 8 7}$ | -0.0714 |  |
| 2 | 1 | 3 | 3 | 1 | $\mathbf{3 . 2 8 5 7}$ | 0.2857 |  |
| 3 | 2 | 5 | 10 | 4 | $\mathbf{4 . 6 4 2 8}$ | -0.3571 |  |
| 4 | 3 | 5 | 15 | 9 | $\mathbf{6 . 0 0 0 0}$ | 1.0000 |  |
| 5 | 4 | 9 | 36 | 16 | $\mathbf{7 . 3 5 7 1}$ | -1.6428 |  |
| 6 | 5 | 8 | 40 | 25 | $\mathbf{8 . 7 1 4 3}$ | 0.71428 |  |
| 7 | 6 | 10 | 60 | 36 | $\mathbf{1 0 . 0 7 1 4}$ | 0.0714 |  |
| $\Sigma$ | 21 | 42 | 164 | 91 |  | 0.00008 |  |

Substituting the values from the table into the system below

$$
\begin{aligned}
n a_{0}+a_{1} \sum_{i=1}^{n} x_{i} & =\sum_{i=1}^{n} y_{i} \\
a_{0} \sum_{i=1}^{n} x_{i}+a_{1} \sum_{i=1}^{n} x_{i}^{2} & =\sum_{i=1}^{n} x_{i} y_{i}
\end{aligned}
$$

we get

$$
\begin{aligned}
7 a_{0}+21 a_{1} & =42 \\
21 a_{0}+91 a_{1} & =164
\end{aligned}
$$

Solving the system ${ }^{2}$ we get

$$
\begin{aligned}
& \mathrm{a}_{0}=1.9286 \\
& \mathrm{a}_{1}=1.3571
\end{aligned}
$$

Therefore, the equation to curve-fit the data with a straight line is:

$$
\mathbf{Y}_{\mathrm{i}}=1.9286+1.3571 \mathrm{x}_{\mathrm{i}}
$$

[^1]
## CURVE FITTING

## Curve Fitting with an n-degree polynomial:

For an n -degree polynomial fit the data can be fitted by

$$
Y_{i}=a_{0}+a_{1} x_{i}+a_{2} x_{i}^{2}+\ldots+a_{m} x_{i}^{m}
$$

Applying the least square criterion:

$$
\begin{aligned}
& \frac{\partial Q}{\partial a_{0}}=\sum_{i=1}^{n} 2\left(a_{0}+a_{1} x_{i} \quad a_{2} x_{i}^{2}+\ldots+a_{m} x_{i}^{m}-y_{i}\right)=0 \\
& \frac{\partial Q}{\partial a_{1}}=\sum_{i=1}^{n} 2\left(a_{0}+a_{1} x_{i} \quad a_{2} x_{i}^{2}+\ldots+a_{m} x_{i}^{m}-y_{i}\right) x_{i}=0 \\
& \\
& \quad \cdot \\
& \\
& \frac{\partial Q}{\partial a_{m}}=\sum_{i=1}^{n} 2\left(a_{0}+a_{1} x_{i} a_{2} x_{i}^{2}+\ldots+a_{m} x_{i}^{m}-y_{i}\right) x_{i}^{m}=0
\end{aligned}
$$

we obtain the following system of $m$ equations in $m$ unknowns:

$$
\begin{aligned}
& n a_{0}+a_{1} \sum_{i=1}^{n} x_{i}+a_{2} \sum_{1}^{n} x_{2}^{2}+\ldots+a_{m} \sum_{1}^{n} x_{i}^{m}=\sum_{i=1}^{n} y_{i} \\
& a_{0} \sum_{i=1}^{n} x_{i}+a_{1} \sum_{1}^{n} x_{i}^{2}+a_{2} \sum_{1}^{n} x_{i}^{3}+\ldots+a_{m} \sum_{1}^{n} x_{i}^{m+1}=\sum_{i=1}^{n} x_{i} y_{i} \\
& \ldots \\
& a_{0} \sum_{i=1}^{n} x_{i}^{m}+a_{1} \sum_{1}^{n} x_{i}^{m+1}+a_{2} \sum_{1}^{n} x_{i}^{m+2}+\ldots+a_{m} \sum_{1}^{n} x_{i}^{m+m}=\sum_{i=1}^{n} x_{i_{i}}^{m} y_{i}
\end{aligned}
$$

## CURVE FITTING

## Example

Curve fit the data below using a parabola:
x:
$\begin{array}{llllllll}1 & 3 & 4 & 5 & 6 & 7 & 8 & 9\end{array} 10$
$y$ :
2781011111098

| n | $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{y}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}{ }^{2}$ | $\mathrm{x}_{\mathrm{i}}{ }^{2} \mathrm{y}_{\mathrm{i}}$ | $\mathrm{x}_{\mathrm{i}}{ }^{3}$ | $\mathrm{x}_{\mathrm{i}}{ }^{4}$ | $\mathbf{Y}_{\mathrm{i}}$ | $\mathbf{Y}_{\mathrm{i}-}-\mathrm{y}_{\mathrm{i}}$ | $\left(\mathbf{Y}_{i}-\mathrm{y}_{\mathrm{i}}\right)^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 2 | 2 | 1 | 2 | 1 | 1 |  |  |  |
| 2 | 3 | 7 | 21 | 9 | 63 | 23 | 81 |  |  |  |
| 3 | 4 | 8 | 32 | 16 | 128 | 64 | 256 |  |  |  |
| 4 | 5 | 10 | 50 | 25 | 250 | 125 | 625 |  |  |  |
| 5 | 6 | 11 | 66 | 36 | 396 | 216 | 1296 |  |  |  |
| 6 | 7 | 11 | 77 | 49 | 539 | 343 | 2401 |  |  |  |
| 7 | 8 | 10 | 80 | 64 | 640 | 512 | 4096 |  |  |  |
| 8 | 9 | 9 | 81 | 81 | 729 | 729 | 6561 |  |  |  |
| 9 | 10 | 8 | 80 | 100 | 800 | 1000 | 10000 |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |
| $\Sigma$ | 53 | 76 | 489 | 381 | 3547 | 3013 | 25317 |  |  |  |

$$
\begin{aligned}
n a_{0}+a_{1} \sum_{i=1}^{n} x_{i}+a_{2} \sum_{i=1}^{n} x_{i}^{2} & =\sum_{i=1}^{n} y_{i} \\
a_{0} \sum_{i=1}^{n} x_{i}+a_{1} \sum_{i=1}^{n} x_{i}^{2}+a_{2} \sum_{i=1}^{n} x_{i}^{3} & =\sum_{i=1}^{n} x y_{i} \\
a_{0} \sum_{i=1}^{n} x_{i}^{2}+a_{1} \sum_{i=1}^{n} x_{i}^{3}+a_{2} \sum_{i-1}^{n} x_{i}^{4} & =\sum_{i=1}^{n} x^{2} y_{i} \\
9 \mathrm{a}_{0}+53 \mathrm{a}_{1}+381 \mathrm{a}_{2} & =76 \\
53 \mathrm{a}_{0}+381 \mathrm{a}_{1}+3017 \mathrm{a}_{2} & =489 \\
381 \mathrm{a}_{0}+3017 \mathrm{a}_{1}+25317 \mathrm{a}_{2} & =3547
\end{aligned}
$$

Solve the system to find $a_{0}, a_{1}$, and $a_{2}$.
Thus the above data can be curve-fitted with the following equation

$$
Y_{i}=-1.4597+3.6053 x_{i}-0.2676 x_{i}^{2}
$$

## CURVE FITTING

## Power Function $y=c x^{n}$

To curve-fit a set of data using a power function we transform $y=c x^{n}$ to a polynomial. We can accomplish the transformation by taking the log of both side of the equation $y=c x^{n}$.

$$
\log y=\log c+n \log x
$$

Letting $\log y=Y, \log c=m$, and $\log x=X$ we can re-write the above equation in a linear form as:

$$
Y=m+n X
$$

To find the values for $m$ and $n$ we solve the system:

$$
\begin{aligned}
k m+n \sum_{i=1}^{k} X_{i} & =\sum_{i=1}^{k} Y_{i} \\
\sum_{i=1}^{k} X_{i} m+n \sum_{i=1}^{k} X_{i}^{2} & =\sum_{i=1}^{k} X_{i} Y_{i}
\end{aligned}
$$

Since $m=\log c$, then $c=10^{m}$. By substituting $n$ and $c$ into the power equation we can use it to curve fit the given data.

## Example

Curve-fit the data using a power function
x:
2
4
5
6
8
$y$ :
0.7500
0.1875
$0.1200 \quad 0.0833$
0.0469

| $k$ | $x_{i}$ | $y_{i}$ | $\mathbf{X}$ <br> $(\log x)$ | $\mathbf{Y}$ <br> $(\log y)$ | $\mathbf{X}^{2}$ | $\mathbf{X Y} \mathbf{Y}_{i}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 0.7500 | 0.3010 | -0.1249 | 0.0906 | -0.0376 |
| 2 | 4 | 0.1875 | 0.6021 | -0.7270 | 0.3625 | -0.4377 |
| 3 | 5 | 0.1200 | 0.6988 | -0.9208 | 0.4886 | -0.6436 |
| 4 | 6 | 0.0833 | 0.7782 | -1.0793 | 0.6055 | -0.8399 |
| 5 | 8 | 0.0469 | 0.9031 | -1.3288 | 0.8156 | -1.2001 |
|  |  |  |  |  |  |  |
| $\Sigma$ |  |  | 3.2832 | -4.1808 | 2.3628 | -3.1589 |

$$
Y=m+n X
$$

## CURVE FITTING

Since $\mathrm{Y}=\mathrm{m}+\mathrm{nX}$ is a linear function, we form a system of two equations in two unknowns:

$$
\begin{array}{r}
5 m+3.2833 n=-4.1809 \\
3.2833 m+2.3628 n=-3.1589
\end{array}
$$

Solve for m and n :

$$
\begin{aligned}
& m=0.4769 \\
& n=-1.9997 \cong-2.0
\end{aligned}
$$

Since $m=\log \mathrm{c}$ :

$$
\begin{array}{rlrl}
0.4769 & =\log _{\mathrm{C}} \mathrm{C} & \text { which implies } \\
\mathrm{C} & =10^{0.4769} & \text { or } & \\
\mathrm{C} & =2.9998 & \text { or } \\
\mathrm{C} \cong 3.0 &
\end{array}
$$

$\therefore$ To curve-fit the given data we use the power function $\mathbf{y}=\mathbf{3} \mathbf{x}^{-2.0}$

## CURVE FITTING

## Exponential Function $y=a e^{b x}$

To curve-fit a set of data using an exponential function we use the same procedure as before. That is, we transform $y=a e^{b x}$ into a polynomial. We can accomplish the transformation by taking the log of both side of $y=a e^{b x}$.

$$
\ln y=\ln a+b x
$$

Letting $\ln \mathrm{y}=\mathrm{Y}, \quad$ and $\ln \mathrm{a}=\mathrm{c}$ we can re-write the above equation in a linear form as:

$$
Y=c+b x
$$

From the system

$$
\begin{aligned}
k c+b \sum_{i=1}^{k} x_{i} & =\sum_{i=1}^{k} Y_{i} \\
\sum_{i=1}^{k} x_{i} c+b \sum_{i=1}^{k} x_{i}^{2} & =\sum_{i=1}^{k} x_{i} Y_{i}
\end{aligned}
$$

We find $b$ and $c$. Since $c=\ln a$, then $e^{c}=a$. By substituting $a$ and $b$ into the exponential function we can use it to curve fit the given data.

## Example

Curve-fit the data using a power function

| $x:$ $y:$ | $\begin{array}{r} -4 \\ 0.57 \end{array}$ |  | $\begin{gathered} 0 \\ 4.12 \end{gathered}$ | $\begin{gathered} 1 \\ 6.65 \end{gathered}$ | $\begin{gathered} 2 \\ 11.0 \end{gathered}$ | $\begin{gathered} 4 \\ 30.3 \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| k | $\mathrm{x}_{\mathrm{i}}$ | $\mathrm{y}_{\mathrm{i}}$ | $\begin{gathered} \mathbf{Y} \\ (\ln y) \end{gathered}$ | $\mathrm{xi}^{2}$ | $\mathrm{x}_{\mathrm{i}} \mathbf{Y}_{\text {i }}$ |  |
| 1 | -4 | 0.57 | -0.5621 | 16 | 2.2485 |  |
| 2 | -2 | 1.32 | 0.2776 | 4 | -0.5553 |  |
| 3 | 0 | 4.12 | 1.4159 | 0 | 0.0000 |  |
| 4 | 1 | 6.65 | 1.8946 | 1 | 1.8946 |  |
| 5 | 2 | 11.0 | 2.3980 | 4 | 4.7958 |  |
| 6 | 4 | 30.3 | 3.4112 | 16 | 13.6446 |  |
| $\Sigma$ |  |  | 8.8352 | 41 | 22.0282 |  |

$$
Y=c+b x
$$

Since $Y=c+b x$ is a linear function, we form a system of two equations in two unknowns:

## CURVE FITTING

$$
\begin{array}{r}
6 c+1.0 b=8.8350 \\
1.0 c+41 b=22.0282
\end{array}
$$

Solve for b and c :

$$
\begin{aligned}
& b=0.5034 \\
& c=1.3886
\end{aligned}
$$

Since $c=\ln a$

$$
\begin{aligned}
1.3886 & =\ln \mathrm{a} \quad \text { which implies } \\
\mathrm{a} & =\mathrm{e}^{1.3886} \text { or } \\
\mathrm{a} & =4.01
\end{aligned}
$$

$\therefore$ To curve-fit the given data we use the power function $y=4.01 e^{0.5034 x}$
